

Chalten - Completando un Modelo de Representacion del Tiempo

The objects representing times, dates and timestamps come up in all sorts of applications. With so much use, it would be reasonable to assume they are well developed and capable of carrying the weight of modeling our intentions as developers. As seen in many other contexts, the author illustrates that it is often very valuable to question such assumptions. In this presentation we will see a more developed and complete way of giving rise to the objects we tacitly think about when we think about dates and times.
